Reverse Osmosis Systems

EMMAR Marketing Services offers a wide range of Reverse Osmosis Systems in water treatment to cater to the needs of Industry.

WHAT IS REVERSE OSMOSIS ?

Reverse Osmosis Process is a membrane process in which a synthetic semi-permeable membrane is used to separate water from dissolved impurities. When a semi permeable membrane separates a dilute and concentrate solution of salts, due to osmosis, the water from the dilute solution side passes through the membrane to the concentrated side till the osmotic equilibrium is obtained.

Now, if the pressure is applied and increased gradually on the concentrated side, the flow of water continues to reduce till the applied pressure reverses the direction of flow of water and water from the concentrated side enters the dilute side. This is what is called the Reverse Osmosis.

It is very essential to ensure that the water fed to reverse osmosis membranes is free from particulate matter, scale-forming salts of Ca & Mg to prevent membrane fouling. Also the water should be free from organic matter, heavy metals and oxidizing agents like free chlorine.
