What is Document Digitization?

Document Digitization is the process of converting documents into digital formats. Document scanning (Digitization) transforms paper documents into electronic images that can be used in computer based business applications and archives. A document scanning system includes a document scanner and software to handle the image produced by the device. A successful document scanning system also includes image enhancement or image processing software such as to automatically improve the images produced by the scanner.

In the process of document digitization, any type of document, images or business cards are digitized and converted into digital formats such as pdf, searchable pdf, encrypted pdf, ıpeg, tıff or mtıff.

Document Digitization is meant for improving staff efficiency, thereby providing cost efficiency and results in better customer services. Documents in hard copy format are very difficult to handle, because the cost of storage, archive and retrieval is too high.

The most vital contribution of data digitization is a perpetual preservation of your important documents. Another benefit is that digitized data can also be stored on any media format such as CDs.

Benefits of Document Digitization:

- Perpetual preservation of all your vulnerable physical documents
- Cost saving in storage space
- Effortless duplication of data
- Quick and easy retrieval at many locations at once
- Easy transportation and sharing simultaneously
- Disaster management and business continuity plan
- Cost reduction and increase in profit
