To,
Mr. Haribabu,

Several follow-ups also the creative power solution person is not responding as till now they have not rectified the issue. The new generator (100 KVA) is automatically getting switched on in night time. The result is unnecessary diesel consumption is happening. The DG set person is saying that it is power voltage issue in Transformer in which reason the generator is switching on in power mode.

The same we spoken with Mr. Venu Babu for power up down in 2nd Transformer, but Venu Babu saying their is no problem in transformer power, as generator person only to make the maximum setting in generator, but the generator person is not accepting the maximum setting option.

Note: 1st Generator (125 KVA Graves make) their is no problem from day one onwards.

Hence kindly suggest us sir.

Regards,

S.V.Subba Reddy.

Dear Haribabu sir,

Please hold the payment of Creative power solutions which is supplied 100 KVA Generator for C & D - Block due to frequently breakdown of generator at night time. The issue is by default night time continuously getting switching on while power mode also. The same we informed to them to rectify this issue but something story is saying.

Hence please speak to them once and ask to visit their senior engineer to rectify this issue.

Thank you,

Regards,

S.V Subba Reddy
